

Manufacturing

- After many hours of preparation, NPK Manufacturing has expanded! The doors are now open at its second facility (MFG Plant II) also located in Wickliffe, Ohio.
- The new building has been acquired primarily as a home for NPK's new robotic welding cell and welding operations.
- With sales and production volume up over the last few years, NPK Manufacturing has been struggling to keep up with production requirements in the confines of the existing building. Equipped with a five-ton overhead crane and 20' of hook height and 25' of clear height, Plant II will increase shop floor production capacity by 50%.
- The new facility houses welding booths and the latest addition, the new robotic welding cell. This facility will be used for welding parts that have been fit up at Manufacturing's first building (MFG Plant I). Parts will be welded by both the robot and the welders.
- MFG Plant II will operate two shifts per day.
