- There is a new addition to NPK's comprehensive line of attachments. The new U-Series Primary/Secondary Crushers succeed the G Series Secondary Crusher Line with new and more powerful features. The improved tooth configuration utilizes a high profile center tooth and lower profile teeth on both sides of the moveable jaw, these versatile crushers can handle both primary and secondary concrete applications.
- Now cutting-torch operations can be eliminated. U-Series Crushers are equipped with a replaceable, high-strength steel center cutter that slices through rebar and light steel structures. There are four models in the new line, the U-21J and U-31J, both with fixed mounting brackets and the U-21JR and U-31JR that are equipped with full 360° power rotation allowing for maximum versatility.
- At demolition sites, sizing with a new NPK U-Series Concrete Crusher saves time and money by reducing the number of trips needed to haul material away. At recycling plants, NPK Concrete Crushers can easily crush reinforced concrete, separating rebar and reducing large pieces of concrete for processing. The U-Series Crushers also have bolt-on replaceable teeth, allowing the replacement of worn or damaged teeth more efficiently and reducing downtime.
